PROFESSIONAL SUMMARY

Senior Full Stack Software Engineer with 6+ years of experience designing scalable cloud-native applications and microservices across AWS, GCP, and Azure. Deep expertise in Java, Spring Boot, and Angular, with a proven record of driving performance improvements, leading platform modernizations, and mentoring engineers. Currently leading multi-cloud enablement of a Java microservices platform — abstracting AWS-native services behind provider-neutral interfaces so the same codebase serves both existing AWS clients and net-new GCP clients. Skilled in serverless and event-driven architectures, CI/CD automation, and observability across distributed systems.

PROFESSIONAL EXPERIENCE

Senior Software Engineer | Epsilon, Dallas, TX

Oct 2022 – Present

- Re-architected AWS-native Java/Spring Boot services into a cloud-agnostic service layer, abstracting storage, messaging, secrets, and identity behind provider-neutral interfaces so a single codebase deploys to AWS, GCP, and Azure without per-client forks.
- Extended the existing serverless stack (AWS Lambda + API Gateway) to GCP by mapping functions onto Cloud Run/Cloud Functions fronted by GCP API Gateway, maintaining API contract parity across providers through shared OpenAPI specifications.
- Led onboarding of net-new GCP clients onto the platform, owning the deployment path end to end — infrastructure provisioning, cloud-profile-driven service configuration, and environment promotion through to production cutover.
- Migrated persistence to AlloyDB for GCP deployments while retaining a single PostgreSQL-compatible data access layer; tuned connection pooling, IAM-based authentication, and read-pool routing for serverless workloads.
- Standardized cross-cloud observability on the ELK/Kibana stack with structured JSON logging and correlation IDs, enabling a single request to be traced across AWS and GCP services from one dashboard and cutting triage time during incidents.
- Validated cross-cloud data integrity in Databricks, reconciling pipeline outputs between AWS and GCP runs to confirm functional parity before client cutover.
- Led full-stack modernization of a large-scale messaging platform using Angular, Java, Spring Boot, and MongoDB, improving UI responsiveness by 35% and increasing user retention by 15%.
- Designed GraphQL APIs and RESTful microservices, reducing API response times by 30% and enhancing data retrieval efficiency across distributed systems.
- Architected a reusable Angular component library integrated with RxJS, reducing frontend development time by 25% across multiple teams.
- Refactored monolithic applications into microservices and event-driven architectures using Kafka, improving scalability and deployment flexibility.
- Implemented a Redis caching layer, cutting DB query load by 50% and improving overall API throughput significantly.
- Automated CI/CD pipelines with GoCD and GitHub Actions, enabling 50% faster zero-downtime deployments; enforced code quality via SonarQube, resolving 200+ code smells per month.
- Mentored junior engineers through structured code reviews, pair programming sessions, and architectural design discussions, fostering a culture of engineering excellence.

Software Developer II | Epsilon, Dallas, TX

Oct 2020 – Sep 2022

- Designed and implemented RESTful APIs using Java and Spring Boot, increasing data synchronization efficiency by 30%; leveraged Spring Data JPA for MySQL integration, reducing data access latency by 20%.
- Developed highly reusable UI components in Angular and TypeScript, reducing code duplication by 35% and accelerating feature delivery across teams.
- Led migration from Angular 5 to Angular 15+, reducing bundle sizes by 25% and runtime errors by 30% through strict TypeScript adherence and component refactoring.
- Streamlined backend workflows using Kafka for real-time data streaming on critical operational pipelines; improved MySQL query performance via indexing, reducing retrieval times by 15%.
- Implemented Cypress E2E testing and Taiko UI automation, cutting regression testing time by 50%; collaborated with UI/UX teams to improve cross-device compatibility by 20%.

Software Developer I | Epsilon, Dallas, TX

Jan 2020 – Sep 2020

- Developed and maintained Angular web applications with RESTful APIs, contributing to a 20% increase in application performance and user engagement.
- Resolved critical API bottlenecks in Java services via thread pooling and connection reuse, slashing response times by 40%.
- Implemented NgRx for centralized state management, reducing redundant API calls by 50% and improving dashboard load times across the platform.
- Integrated the ELK Stack (Elasticsearch, Logstash, Kibana) for centralized logging and real-time monitoring, reducing system downtime by 20%.

- Practiced Test Driven Development (TDD) using Karma and Jasmine, achieving 90% unit test coverage and ensuring robust application quality.

Software Developer Intern | Epsilon, Dallas, TX

Jun 2019 – Dec 2019

- Modernized Java modules for the People Cloud Messaging product using Factory and Singleton design patterns, improving runtime efficiency by 50%.
- Redesigned MySQL schemas for a marketing analytics tool, accelerating data retrieval by 20%; authored technical documentation ensuring seamless knowledge transfer across teams.

Software Engineer Intern | Hoonuit, Minneapolis, MN

Aug 2018 – Jan 2019

- Developed reusable Java-based ETL connectors, reducing implementation time by 70% and optimizing data pipelines for extraction, transformation, and loading.
- Designed SaaS-based dashboards using Java and Spring Boot with advanced analytics capabilities, contributing to a 40% revenue increase.

NOTABLE PROJECTS

Document Q&A with RAG — Python, Streamlit, LangChain, OpenAI API, FAISS

- Built an interactive RAG application enabling users to upload documents, rebuild vector indexes, and query content in natural language via LLM-backed responses; reduced document search time by ~70% compared to manual review.

Real-Time Spam Detection Pipeline — Python, AWS (S3, Lambda, SageMaker), Kafka

- Scalable ML pipeline on AWS identifying spammers with 85% accuracy via real-time Kafka event streams, reducing fraudulent activity by 60%.

Twitter Sentiment Engine — Kafka, Scala, Spark Streaming, Kibana

- Processed 10,000+ tweets/sec using Kafka and Scala, delivering real-time sentiment dashboards with sub-second latency for marketing teams.

Portfolio Website — Angular, TypeScript, HTML5, CSS3

- Developed a responsive personal portfolio optimized for performance and accessibility, achieving 95+ Lighthouse scores across all metrics.

TECHNICAL SKILLS

Cloud Platforms: AWS (Lambda, API Gateway, S3, EC2, SageMaker), GCP (Cloud Run, Cloud Functions, API Gateway, AlloyDB, Cloud Storage, Pub/Sub), Azure; multi-cloud service abstraction and workload portability

Backend: Java, Spring Boot, Spring Data JPA, Node.js, Python, GraphQL, RESTful APIs, OpenAPI

Frontend: Angular (v5–21), React, TypeScript, JavaScript, RxJS, NgRx, HTML5, CSS3

DevOps & Infrastructure: Docker, Kubernetes, Terraform, CI/CD (GoCD, GitHub Actions, Jenkins), serverless deployment

Databases: PostgreSQL, AlloyDB, MongoDB, MySQL, Cassandra, Redis, Elasticsearch

Data & Observability: Databricks, ELK Stack (Elasticsearch, Logstash, Kibana), structured logging, distributed tracing

Messaging & Architecture: Kafka, Pub/Sub, Event-Driven Architecture, Microservices, Serverless

Testing & Quality: Cypress, Karma, Jasmine, JUnit, Taiko, SonarQube, TDD

Tools & Practices: Git, Jira, Confluence, Postman, Agile/Scrum, System Design, Code Review, Technical Mentorship

EDUCATION

M.S. Computer and Information Sciences

Dec 2019

The University of Texas at Dallas

B.Tech. Electrical and Electronics Engineering

May 2017

National Institute of Technology (NIT), Calicut, India
